# Week-01-Overview of C, Constants, Variables and Data Types

# Week-01-02-Practice Session-Coding

Write a program to input a name (as a single character) and marks of three tests as m1, m2, and m3 of a student considering all the three marks have been given in integer format.

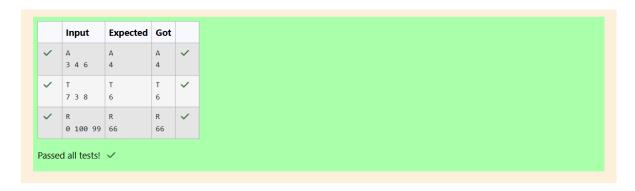

Now, you need to calculate the average of the given marks and print it along with the name as mentioned in the output format section.

All the test marks are in integers and hence calculate the average in integer as well. That is, you need to print the integer part of the average only and neglect the decimal part.

# Source Code:

```
Answer: (penalty regime: 0 %)
     1 #include<stdio.h>
     2
         int main()
    3 ▼
    4
               char ch;
               int a,b,c,d;
scanf("%c",&ch);
scanf("%d %d %d\n",&a,&b,&c);
     5
     6
     7
              d=(a+b+c)/3;
printf("%c\n",ch);
printf("%d",d);
    8
    9
    10
    11
               return 0;
    12 }
```

# Result:

Question 2 Correct 5.00 ₹ Flag question

```
Some {\it C} data types, their format specifiers, and their most common bit widths are as follows:
    Int ("%d"): 32 Bit integer
     Long ("%ld"): 64 bit integer
     Char ("%c"): Character type
· Float ("%f"): 32 bit real value
· Double ("%lf"): 64 bit real value
Reading
To read a data type, use the following syntax:
scanf("`format_specifier`", &val)
For example, to read a character followed by a double:
char ch;
double d;
scanf("%c %lf", &ch, &d);
```

For the moment, we can ignore the spacing between format specifiers.

#### Printing

To print a data type, use the following syntax: printf("`format\_specifier`", val) For example, to print a character followed by a double: char ch = 'd'; double d = 234.432; printf("%c %lf", ch, d);

Note: You can also use cin and cout instead of scanf and printf; however, if you are taking a million numbers as input and printing a million
